

Key Findings

Finding 1: A 69% Drop at the first funnel step is the business's core problem

Out of 5,000 users who viewed a page, only **1,553 (31.1%)** added an item to cart. This is the steepest single-step drop in the entire funnel. The funnel is not broken at the bottom; it's leaking at the top.

- Product pages are not doing their job. Users are browsing but not engaging.
- Pricing, images, CTAs, or trust signals may be weak on product pages.

Recommended action:

- Split view-to-cart rates by product id to identify which products have the lowest engagement.
- A/B test product page layouts, pricing display, and CTA button copy

Finding 2: Email is the highest-quality channel — But the smallest

Email converts at **33.9%**, nearly double the site average (16.5%) and 5× better than social. However, email also sends the **fewest visitors (522)** just 10.5% of total traffic.

	Channel	Visitors	Revenue Contribution
	Email	522	\$18,831 (21.4% of rev)
	Organic	2,038	\$36,499 (41.5% of rev)
	Paid Ads	968	\$21,714 (24.7% of rev)
	Social	1,472	\$10,860 (12.4% of rev)

Email subscribers are the highest-intent users. Growing the list — through pop-ups, lead magnets, post-purchase capture — directly increases the highest-converting segment.

Finding 3: Social media has a Channel-fit problem

Social sends **1,472 visitors** (29.4% of traffic) but converts only **6.9%** of them.

Social audiences typically arrive in discovery mode, not purchase mode. The current experience (likely direct product landing pages) is not designed for cold, low-intent traffic.

- Social ROI is poor if the goal is direct conversion.
- Social should either be repositioned as a brand/awareness channel or landing pages for social traffic should be redesigned with nurture-first content, email capture, or retargeting triggers.

Finding 4: Once users reach checkout, the business converts well

From checkout start onward:

- Checkout → Payment: **81.5%**
- Payment → Purchase: **91.9%**

This is strong. Most e-commerce businesses struggle at the payment step (average industry dropout is 25–40% at checkout). Here, less than 10% abandon after entering payment info.

- The checkout UX is solid. Do not disrupt it.
- Pre-checkout investments (product pages, marketing, channel quality) will have the highest ROI because the funnel below checkout is already efficient.

Finding 5: The 25-minute journey suggests high-intent buyers

Converted users take on average:

- **11.2 minutes** from first view to adding to cart
- **13.5 minutes** from cart to completing purchase
- **24.6 minutes** total journey

This is fast. It means buyers who convert do so decisively. They are not comparison shopping extensively or abandoning and returning days later.

Focus should be on increasing the top of funnel — getting *more* users to start the journey, not on accelerating users who are already moving quickly.

Finding 6: Average Order Value is mid-range with consistent distribution

AOV is **\$106.51** with a standard deviation of \$52.88, ranging from \$20 to \$199.

The distribution is roughly uniform — no extreme outliers or heavy clustering at one price point. With only 6 products in the dataset, each product likely occupies a different price tier.

Recommendation :

- Segment AOV by product id to see if high-value products have lower conversion (price resistance) or similar conversion (price-insensitive buyers).
- If high-value products convert at similar rates, upsell/bundle strategies could lift AOV meaningfully.
